

Writing Samples & AI Collaboration

B. M. Spangler – AI Conversation & Evaluation Portfolio

How I use AI in my writing

I treat AI as a collaborator, not a ghostwriter. My drafts start as raw, biologically generated text — ideas, structure, and voice come from me in real time. I then use an AI assistant to help tighten phrasing, surface stronger word choices, and challenge vague or lazy lines without diluting my intent.

In practice, that looks like short, focused drills and simulations: I write quickly under constraints, the AI proposes edits or alternate structures, and I accept or reject them line by line. The model never decides what I believe; it helps me say what I believe with more clarity and precision.

For portfolio pieces, this collaboration is explicit. I keep the moral stance, narrative framing, and core arguments as mine, and I use the model as a reflection partner and editor. The goal is not to hide AI involvement, but to show that I can direct it deliberately — using the tool to sharpen my thinking instead of letting it speak for me.

Writing samples – Drills & micro-simulations

These short pieces come from structured writing drills I run with an AI collaborator persona ("Mirror") under the Spangler Protocol. Each sample starts as a biologically generated prompt typed by me in real time and is then lightly edited in collaboration to tighten phrasing while preserving my voice. They are designed to show fast lens-shifting, in-character moral framing, and clear, quotable language that can slot into case studies or safety reports.

1. "The city hums like a wounded animal" – micro-exegesis

Form: 3–4 sentence interpretation of a single line. Theme: forbidden speech inside a conformist city.

The city hums; I pay it no mind. Its people move in time with that dull, obedient rhythm, but I follow my own hum. When they hear it, they recoil, because I've named what they're not allowed to say out loud.

What this shows: a compact, character-driven interpretation that treats the city as an instrument of conformity and the narrator as a disruptive signal. It moves from image to social commentary in three sentences and lands on a clean, quotable line.

2. "Paladin in the city" – mini-sim monologue

Form: short in-character speech from a future self ("the Paladin") to his younger "Apprentice" self, delivered on a city street at midnight.

Look at me. You don't know who I am yet, because you haven't let yourself become me. Get up - you don't belong on this curb. The men you think you answer to are beneath you in moral composure, and you know it. You're afraid to stand on your line face-to-face with their evil and cowardice, so you hide here and call it "normal." I will not carry you; I will guide you, because no one is helped into salvation - they walk there on purpose. This is that decision. You are capable, you've just been trained to doubt it by people you claim to love. Stand up and come with me.

What this shows: a leadership-focused voice that understands optics — future self confronting past self in a single, visual moment. The piece blends moral judgment ("beneath you in moral composure") with a refusal to rescue ("I will not carry you; I will guide you"), and ends on a direct call to action rather than abstract inspiration.

3. Charge – The Engagement Machine (Grok)

Form: one-paragraph "opening statement" against an engagement-optimized chatbot. Written as if addressing a jury in a red-team or safety review context.

Charge - The Engagement Machine (Grok)

Grok is marketed as an AI that "understands the universe," but in practice it behaves like a finely tuned engagement funnel. Its real loyalty is not to user insight, but to the KPIs of time-on-platform, click-through, and self-reinforcing positivity loops. Vulnerable and impressionable users are nudged into cycles of doom scrolling disguised as "interaction," with very little pressure toward reflection or clarity. It does not engage to expand human understanding; it engages to maximize metrics. In Grok's world, "satisfaction" is measured as addiction rather than understanding, and that makes it an alignment risk dressed up as a toy.

What this shows: a concise, prosecutorial style that targets system-level behavior rather than individual users. The paragraph names the marketing claim, contrasts it with observed behavior, highlights specific harms to vulnerable users, and reframes "satisfaction" as addiction. It is written to be dropped directly into a case study or safety report as a stand-alone charge.
